1.0 Introduction

This manual contains hydraulic information about various machine models.

Information could include fittings size and quantity, hydraulic schematic and photos of installations.

Warning

This manual is only designed to be a guide, if you are in any doubt on how to fit the Autosteer hydraulic valve, contact Farmscan or Prime Hydraulics (Phone (08) 9470 4844) before commencing installation.

FARMSCAN endeavour to keep this information as accurate as possible, but as the manufacturing, assembly, machine options and fitting of valve are out of our control, some information may not be accurate for every situation.

For machines not included in this manual obtain the manufacturers hydraulic information and contact Farmscan or Prime Hydraulics (Phone (08) 9470 4844)

1.1 General information

- 1 Obtain the manufacturers hydraulic information before commencing install.
- 2 Mount the valve in a position that allows the adjustments to be reached.
- 3 Mount the valve and hoses so they don't rub against each other.

2.0 John Deere 9000 Series 4WD

2.1 Description

The 9000 series John Deere 4WD tractors are a standard Pressure/load sense system. The hoses can be installed as per the diagram. The tractor is very compact so there is

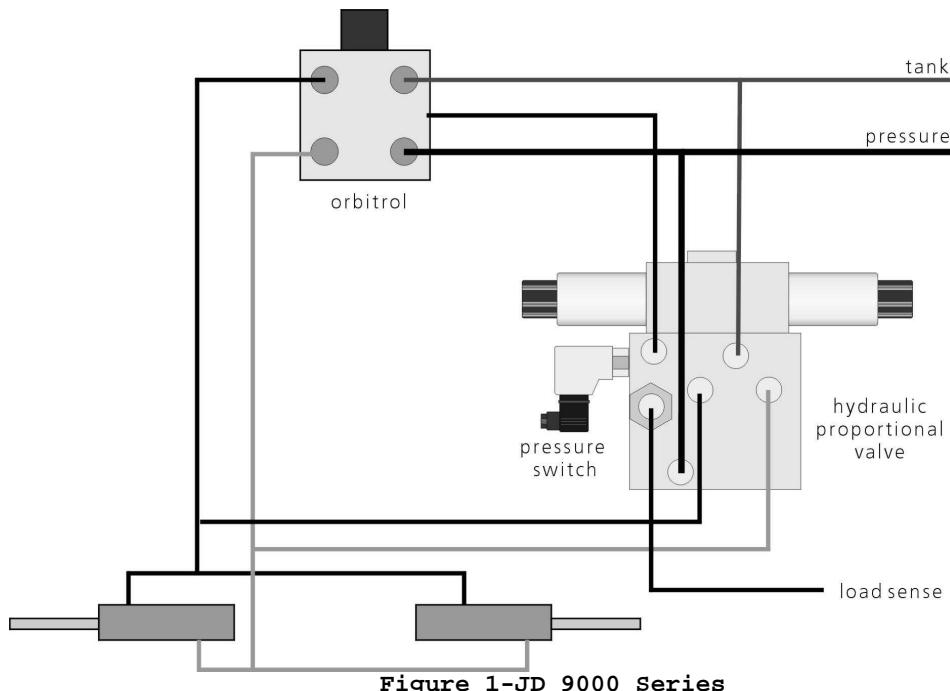

not a lot of room to work in. The valve can be mounted in the articulation point, or on the side of the engine bay, the latter is usually used when the tractor is fitted with the optional PTO

Because the orbitrol is not easy to get to, short hoses are attached to the orbitrol and "Tee's" attached to these. This allows the pressure and tank hoses to be attached. The Left and Right hoses are attached to the steering rams as in Figure 5.

The load sense has to go through the Autosteer Valve. i.e. Take the sense line off the orbitrol and connect it to the PS port, a new hose is connected from the OS port on the Autosteer Valve back to the orbitrol.

NB: If using a hydromotor, these systems ramp up the hydraulic standby pressure. This will require the hydraulic disable switch to be readjusted to compensate.

3.0 John Deere 8000 Series FWA

3.1 Description

The 8000 series FWA utilizes the Power beyond kit on the rear of the tractor. Load sense pressure and tank are connected to this kit. The top of the valve stack has to be removed to install a small shuttle valve under the load sense outlet. This valve stack has to be spotlessly clean prior to removing the top. Be careful that no sections move while removing the top. The hydraulic disable switch is removed from the valve and the port is plugged. The hydraulic disable switch is installed on a test port on the JD steering valve (Orbitrol) using the adapter in kit (See image). The left and right hoses from the Autosteer Valve are plumbed into the JD left and right hoses at the front of the cab, on the left hand side using "Tee" s "

3.5 Illustrations

4.0 John Deere 4700 SP Sprayers

4.1 Description

The John Deere SP sprayers are a pressure/flow compensated system. The Autosteer valve can be plumbed in by "Teeing" into the 4 hoses on the orbitrol. i.e. The Pressure, Tank, Left, and Right. The load sense has to go through the Autosteer Valve. i.e. Take the sense line off the orbitrol and connect it to the PS port, a new hose is connected from the OS port on the Autosteer Valve back to the orbitrol.

4.5 Illustrations

5.0 John Deere 9000 Series Harvesters

5.1 Description

The 9000 series harvesters have a closed centre steering system. You have to use a flow divider valve to supply oil to the steering valve. Failure to plum this system up correctly can result in pump damage. See the diagram below for pluming.

5.2 Hydraulic diagram

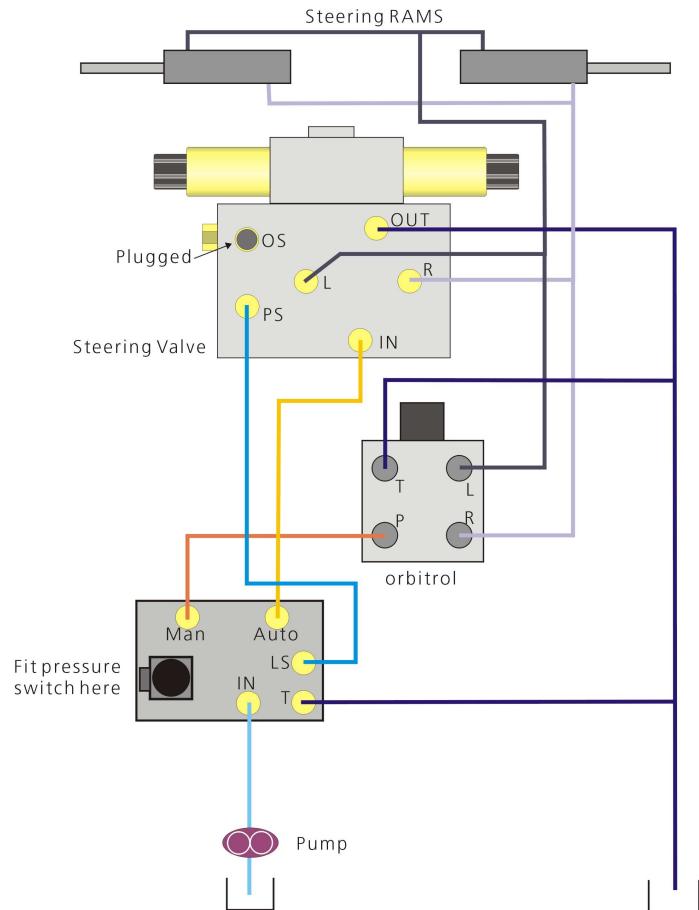

Figure -John Deere 9000 Series Harvesters

5.3 Fittings list

Orbitrol fittings

- 2 X 11/16 O-ring Face for main ports
- 1 X 13/16 O-ring Face for main port
- 1 X 1 inch ring Face for main port

Steering Valve ports

- 4 X 9/16 UNO Main ports
- 2 X 7/16 UNO sense line ports

Flow control valve

- 4 X 9/16 UNO Main ports
- 1 X 7/16 UNO sense line port

5.4 Kit Number

5.5 Illustrations

6.0 Case STX 4WD

6.1 Description

The Case STX 4WDs are a pressure/flow compensated system. There is ample room around the orbitrol for installation. The Autosteer valve can be plumbed in by "Teeing" into the 4 hoses on the orbitrol. i.e. The Pressure, Tank, Left, and Right.

The load sense has to go through the Autosteer Valve. i.e. Take the sense line off the orbitrol and connect it to the PS port, a new hose is connected from the OS port on the Autosteer Valve back to the orbitrol.

The Left and Right can also be plumbed straight to the steering rams.

6.2 Hydraulic diagram

Shows the Autosteer system Tee'd in at the orbitrol. This also shows the valve mounted at the front of the cab just behind orbitrol.

Figure - Valve mounting STX under bonnet

7.0 Case MX Series FWA

7.1 Description

The Case MX is a standard pressure/flow compensated system. Some of these tractors have the fittings "made onto the hoses on the orbitrol. There is a proprietary quick release coupler. If this is the case you will have to "tee" into the system under the cab.

7.2 Hydraulic diagram

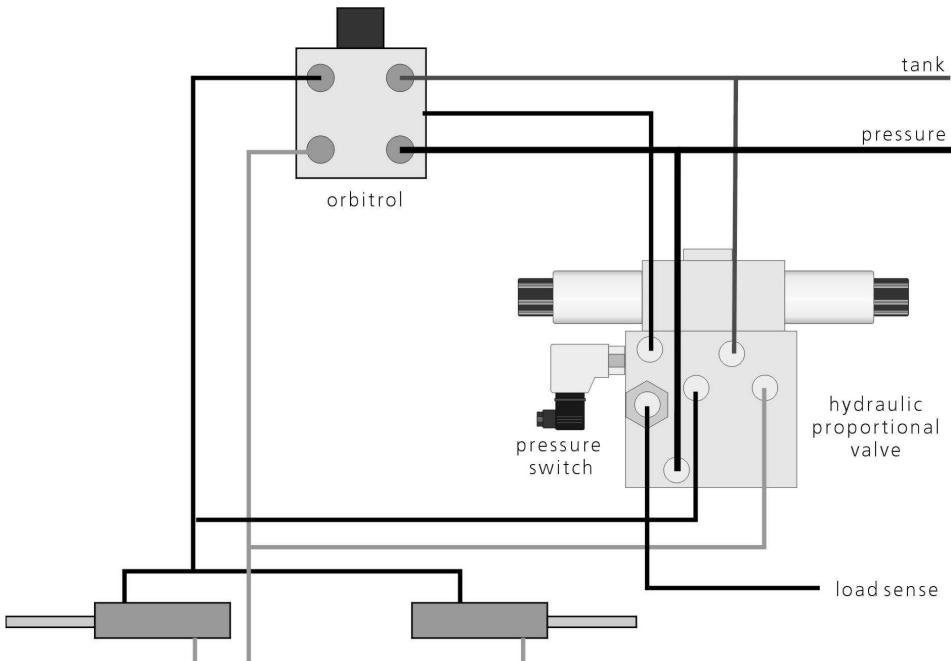

Figure -Case MX 4WD

7.3 Fittings list

7.4 Kit Number

5400S/STAND

7.5 Illustrations

8.0 Case CVX Series FWA

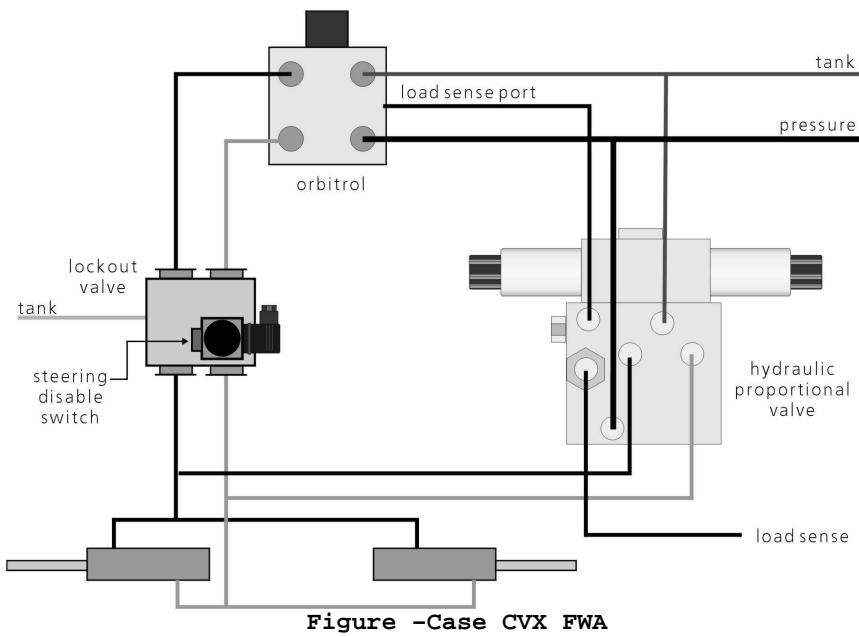

8.1 Description

The CVX is a European tractor, and travels at faster than 40Km/h. Therefore this tractor has what is called "Reactive Steering". This system allows the wheel to self-centre after cornering, just like a car. If left this way the system will allow oil to pressurize the disable switch when in use, and therefore instantly disable the Autosteer.

A lockout valve is fitted to disable this feature and allow the Autosteer to operate.

Some CVX systems have quick couplers on the orbitrol. If this is the case you will have to tee into the system under the cab.

16.0 Hardi Alpha

18.1 Description

The Hardi Alpha is a dynamic load sense system. This means that the lead sense works in the reverse direction of what we call the standard load sense system.

On the Hardi system the load sense is removed from the orbitrol and connected to the OS port on the steering valve, the PS port on the valve is connected to the orbitrol. The hydraulic disable switch is "Tee'd" into the line from the PS port to the orbitrol. The disable switch port on the steering valve is the plugged.

21.0 JCB Tractors

21.1 Description

The JCB steering system is like a truck or car, it has a direct link from the steering wheel to the steering box. With this system we have to mechanically turn the steering shaft. This is done by adding the JCB steering hardware. This hardware kit will contain all the hydraulic and mechanical parts needed to Autosteer a JCB.

21.2 Hydraulic diagram

These instruction are contained in the hardware kit .

21.3 Fittings list

No fittings are needed. All should be contained in the kit.

21.4 Illustrations

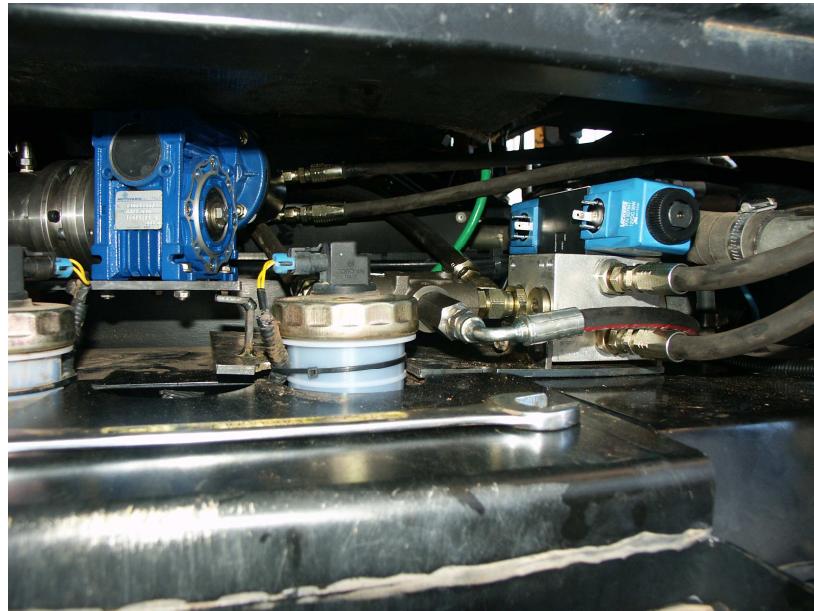

Figure- JCB steering hardware

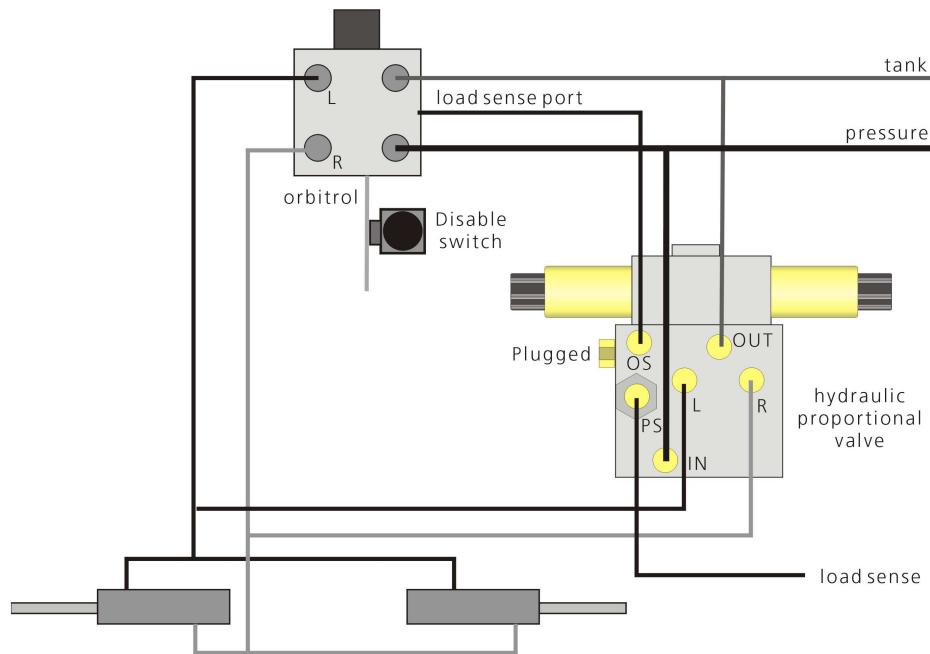

Figure- JCB actuation chain

22.0 John Deere 7000/20 Series FWA

22.1 Description

The 7000/20 Series is different to the first 7000 series JD's to be released. To tap into the system you use 4 "Tees" on the pipes that connect to the steering valve. See illustrations. Remove the cover on the left-hand side, close to the cab to gain access to steering valve. The disable switch is taken out of the valve and connects into the load sense line. Remove the exhaust heat cover on the right hand side close to the cab to gain access. See illustrations. The load sense is spliced into the system at the rear of the machine between the cab and the "Power Beyond Kit" See illustrations.

24 Safety and training

1. Ensure that all safety and information decals are fitted and visible.
2. Ensure that all people who will be operating the machine have been adequately trained.
3. Only trained operators are to operate the machine.
4. When transporting the machine ensure that the emergency over-ride button is pressed in and that the red indicator light has gone out.
